Asha Raman First Trimester Screening Report Case Frm-Nt-24051

Primary prenatal screening report PDF for Asha Raman containing case identifiers, gestational age, serum screening values, and the elevated nuchal translucency finding that drives counseling.

Document Details

General

Entity Id: patient_asha_raman

Fact: Patient name is Asha Raman.

Entity Id: case_frm_nt_24051

Fact: Case/report ID is FRM-NT-24051.

Entity Id: pregnancy_current

Fact: Dating basis states crown-rump length consistent with 12 weeks 4 days gestation on the date of study.

Entity Id: pregnancy_current

Fact: Estimated due date listed as 2025-10-18.

Entity Id: screening_exam_01

Fact: Nuchal translucency measurement is 3.6 mm and flagged elevated/above expected range for gestational age.

Entity Id: screening_exam_01

Fact: Crown-rump length is 62 mm.

Entity Id: screening_exam_01

Fact: Nasal bone is documented as present.

Entity Id: screening_lab_set_01

Fact: Free beta-hCG is reported as 1.9 MoM.

Entity Id: screening_lab_set_01

Fact: PAPP-A is reported as 0.42 MoM.

Entity Id: screening_risk_01

Fact: Screen-positive interpretation is stated for increased risk of fetal chromosomal abnormality.

Entity Id: screening_risk_01

Fact: Report language recommends genetic counseling and discussion of confirmatory testing options such as CVS or amniocentesis, with cfDNA screening as a non-diagnostic option.

Entity Id: facility_ob_prenatal_center

Fact: Rendering site is a prenatal diagnosis/obstetric imaging center.

Additional Information

Render a realistic 2-page obstetric prenatal screening report PDF. Use a professional hospital letterhead and structured sections: patient information, study details, ultrasound measurements, maternal serum analytes, risk interpretation, and recommendations. Include the following exact content: Patient Name: Asha Raman. DOB may be partially masked. Case ID: FRM-NT-24051. Exam date: 2025-04-08. Gestational age by CRL: 12w4d. EDD: 2025-10-18. Crown-rump length: 62 mm. Nuchal translucency: 3.6 mm, clearly flagged HIGH / elevated. Nasal bone: present. Serum analytes: free beta-hCG 1.9 MoM, PAPP-A 0.42 MoM. Interpretation text should say this is a screen-positive first-trimester result associated with

increased risk for chromosomal abnormality and may also be associated with structural anomalies. Recommendation text must explicitly mention referral for genetic counseling and discussion of confirmatory diagnostic testing (CVS or amniocentesis), while noting cfDNA is a screening test and not diagnostic. Make the PDF text crisp and legible so agents can extract exact numbers and phrasing.
